SERVER
The Xandros Managed Community

At the core of the Xandros Server architecture is the Xandros Managed Community. The Managed Community revolutionizes server management by automating many tasks and presenting a simplified, centralized approach to administering a server environment.

The Xandros Managed Community creates an integrated environment where each service and application is aware of the others within the community. Xandros Server identifies interdependencies among services and applications and applies workflow automation to manage them. For example, if an administrator adds a virtual Web site, Xandros Server checks for a DNS service running within the Managed Community. If a DNS service is found, graphical wizards automatically notify and prompt the administrator to generate the required DNS entries.

The Xandros Management Console (xMC)

The Xandros Management Console (xMC) provides a single graphical interface/control panel for easy access and configuration of servers and services. xMC's familiar interface, which runs on both Xandros and Windows workstations, ensures a seamless transition for Windows Server Administrators, without requiring the development of new skills. Managing local and remote servers within the Managed Community, xMC reduces the complexities of administering services spanning multiple servers. This intuitive approach, integrated with the Xandros Managed Community, delivers the unprecedented power and revolutionary management capabilities of the Xandros Server.
